Swedbank Pension Fund V3 (Equity Strategy)

August 31, 2013

Manager Commentary

Swedbank's Pension Fund V3 returned -2.0% in August and 0.3% since the start of the year.

Market overview

August brought a wave of sell-offs to the financial markets due to which equity as well as bond prices suffered. Gold, however, was attractive to investors. The support of economic statistics referring to rather wide global improvement in the economic status was nullified by the possibility of an act of war in Syria and the resulting increase in oil prices (ca 6% in US dollars). Riskier asset classes were weakened by the possibility of a new governmental crisis in Italy and rather modest quarterly results of companies in Europe and USA.

In addition to the events in Syria, one of the important keywords was economic statistics, which were stronger than expected, mainly in developed industrialised economies. The GDP of the euro area in the second quarter increased by 0.3% – these were the first positive growth figures since the decline period of the last six quarters. Positive trends were also noticeable in the periphery of the euro area. The US economic indicators are still moderately increasing. Unemployment decreased by 0.2% to 7.4%. The sentiment in the industrial sector of the USA also improved significantly: the ISM index calculated on the basis of the monthly inquiries of the purchase managers of industrial enterprises, which is widely followed in financial markets, remained strong (above 55 points) for the second month in a row. An index value which is higher than 50 points refers to increasing economic activity in the industrial sector.

At the session of the Federal Reserve Monetary Committee, most of the members supported a reduction in the financial assets purchase programme proposed by the president of the reserve Ben Bernanke, which will probably lead to a decrease in the purchasing of government bonds by the Federal Reserve at the end of the year. The expected decrease in global liquidity due to this has not had a very positive influence on developing market currencies – the currencies of countries that are more dependent on external financing have come under attack first and foremost. The Brazilian real as well as the Indian rupee have suffered considerably. The weakening of currencies could result in accelerated inflation on developing markets, which has been very difficult for them to fight against because, unlike developed regions, there are no signs of improvement as to economic growth. The euro weakened by 0.6% against the US dollar.

By the end of August, most of the large enterprises of Europe and the USA had revealed their economic results for the second quarter. As has been common in the last few years, the results of European companies fell short of those across the Atlantic as to turnover and profit. The decrease in the turnover and profit of European countries continued while the companies traded on the North-American stock exchange managed to achieve minor growth in both areas. Weak profit figures call into question the sustainability of the growth in equity prices we saw last year, as prices have mainly increased due to the price earnings ratio, not an increase in the profitability of companies.

In August, the US market was the weakest of the large equity markets of developed industrialised economies (-2.3%, all returns given in euros), Japanese equities decreased by 1.6% and European equities by 0.6%. Russia was the best performer among developing countries (0.7%); the emerging Asian (-1.0%), Eastern European (-4.8%) and Latin American (-2.6%) markets ended the month in the negative. Baltic equities also weakened (-0.8).

Near-term outlook

In September we will continue with the neutral stance towards equity risk. Several technical indicators have become more supportive for equity markets, incl. the positioning of investors in futures markets. The global economic cycle shows some signs of improvement and the estimate that this will probably continue in the coming quarters also supports the equity markets. A slight weakening of global liquidity flows is having a negative effect on equity market prospects. Political tensions in the United States could also increase in September – Congress is again discussing whether to raise the debt ceiling and the debate will probably be very complicated.

As to regions, we still prefer Russia to Latin America. Compared to other developing markets and to Latin American countries, Russia has a better position, as the country's current account is in surplus and it is therefore less dependent on external financing than Brazil, for example. The price level of Russian equities is also considerably better.

At the end of August we increased the proportion of Japanese equities in pension fund portfolios and reduced that of European and US equities. What lies behind this preference is the more stimulating monetary policies of the Japanese Central Bank, better market climate (equity analysts are increasing their profit expectations significantly) and cheaper price levels.
