Swedbank Pension Fund V3 (Equity Strategy)

September 30, 2013

Manager Commentary

Swedbank's Pension Fund V3 returned 3.5% in September and 3.9% since the start of the year.

Market overview

September proved to be positive on both the bond and equity markets. The direct reason for the rise of financial markets was the surprising decision of the Federal Reserve to not taper the bond purchase programme. The monetary policies of the Federal Reserve, which was more stimulating than expected, led to a rise in almost all financial assets – those which had lost the most while waiting for the central bank's reduction in liquidity supply the whole summer now gained the most.

Politics was once again in sharp focus during the month, and in very different contexts: the action in Syria and the possibility of Western countries intervening in the conflict influenced the commodity markets. The threat of a new governmental crisis came to the fore again after the conviction of Berlusconi on the tax offence, as he threatened to stop supporting the coalition in power and recall his ministers from the government. The deadlines for 2013/14 budget approval and deciding on the debt ceiling were approaching in the United States. By the end of September, the Republicans and Democrats had not agreed on either issue and thus the public sector partially stopped providing services in the USA at the beginning of October. This likely has an actual influence on the country's economic indicators.

The economic growth indicators for the month mostly exceeded the expectations of analysts. Activity in the industrial sector increased somewhat in the United States – the ISM Index rose to 55.7 points. The same index in the industrial sector of the euro area also remained in positive territory (i.e. above 50 points), indicating the possibility that economic growth in the euro area may surprise us positively in the third quarter. Another positive surprise was the economic statistics of China, as the country's export volume increased significantly.

Japan is discussing whether to raise VAT in order to reduce its high budget deficit and how to stop the growth in public debt, which is the highest of any developed industrial country. Increasing the rate of VAT is seen as a major risk to the economy. Governor of the Central Bank Kuroda has said that if the negative impact of a tax increase should endanger the inflation objective (2%), the Central Bank is prepared to additionally stimulate the Japanese economy. The government is also willing to increase its expenditure temporarily in order to mitigate the negative influences of a tax increase.

The surprising decision of the Federal Reserve to delay the reduction in bond purchasing outweighed the intense political situation and most equity markets strengthened significantly during the month. Those in emerging regions were in the leading position this time – both Latin America and Eastern Europe (along with Turkey) ended the month at +6.0% (all returns are in euros). There were large differences within countries in Eastern Europe: the index of Turkey, which had fallen considerably in anticipation of the reduction of the Fed's incentive, increased by ca 10%, whereas Polish equities ended the month at just +4%. The latter was affected by the government's plan to partially nationalise the pension system. Emerging Asian equities rose by 2.9%. Japan was at the forefront of developed regions (+5.7%) and Europe also did well (+4.4%). However, US equities rose by only 0.8%. The equities of the Baltic States were the only exception, as they fell by 0.7%. The euro strengthened 2.3% against the US dollar.

Near-term outlook

In October we will continue at the neutral equity risk level. In our estimation, equities are supported by the increasing speed of global economic growth; financial system liquidity also remains high. However, several technical indicators have weakened. In addition, equity analysts started lowering their estimates in recent weeks regarding the profits of companies for this year and next year.

In October the important factor that will influence financial markets will probably be politics, especially the events in the USA. Most analysts and investors are expecting the Republicans and Democrats to reach an agreement on raising the debt limit on time, as both parties have a lot to lose if they fail to agree. Otherwise the US government will be obliged to reduce governmental costs to such an extent that it will probably lead to a new recession. In the worst case scenario the United States will be temporarily incapable of fulfilling its debt obligations. If this rather improbable scenario were to unfold, the consequences for the global economy would be extremely negative, given the important role US bonds play in the international financial system.

Regionally we have increased the proportion of Japanese equities in our portfolio – the market is supported by the Central Bank's stimulating monetary politics and the fact that equity analysts have improved their prognoses. At the same time, we have reduced the proportion of European equities. Europe's equity market is basically the opposite of that of Japan: liquidity is rather weak and analysts are lowering their unrealistically high profit expectations. We are still positive about Russian equities traded at a rather low price level and somewhat more negative about Latin American equity markets.
